

TEAM ID: PNT2022TMID32368

PROJECT NAME: DemandEst - AI powered Food Demand Forecaster

Team Leader

The screenshot displays a Jupyter Notebook interface with two visible code cells. The first cell, titled "Dropping Columns", contains Python code to drop 'center_id' and 'meal_id' from a DataFrame named 'trainfinal'. The output shows the first five rows of the resulting DataFrame, which includes columns like 'id', 'week', 'checkout_price', 'base_price', 'emailer_for_promotion', 'homepage_featured', 'num_orders', 'category', 'cuisine', 'city_code', 'region_code', and 'center_type'.

The second cell continues the data manipulation by listing the columns of the DataFrame and rearranging them. The output shows the first five rows of the rearranged DataFrame, with columns ordered as 'id', 'week', 'city_code', 'region_code', 'center_type', 'op_area', 'category', 'cuisine', 'checkout_price', 'base_price', 'emailer_for_promotion', and 'homepage_featured'.

The third cell shows the data types of the DataFrame, indicating that 'id' and 'week' are of type 'int64'.

```
In [110]: trainfinal = trainfinal.drop(['center_id', 'meal_id'], axis=1)
trainfinal.head()

Out[110]:
```

	id	week	checkout_price	base_price	emailer_for_promotion	homepage_featured	num_orders	category	cuisine	city_code	region_code	center_type
0	1379560	1	136.83	152.29	0	0	177	Beverages	Thai	647	56	TYPE_C
1	1018704	2	135.83	152.29	0	0	323	Beverages	Thai	647	56	TYPE_C
2	1196273	3	132.92	133.92	0	0	96	Beverages	Thai	647	56	TYPE_C
3	1116527	4	135.86	134.86	0	0	163	Beverages	Thai	647	56	TYPE_C
4	1343872	5	146.50	147.50	0	0	215	Beverages	Thai	647	56	TYPE_C

Display the list of columns present in trainfinal table and store it in variable "cols"

```
In [111]: cols = trainfinal.columns.tolist()
print(cols)

['id', 'week', 'checkout_price', 'base_price', 'emailer_for_promotion', 'homepage_featured', 'num_orders', 'category', 'cuisine', 'city_code', 'region_code', 'center_type', 'op_area']
```

Rearrange the columns by slicing the columns of "cols" and print "cols"

```
In [112]: cols = cols[:2] + cols[9:] + cols[7:9] + cols[2:7]
print(cols)

['id', 'week', 'city_code', 'region_code', 'center_type', 'op_area', 'category', 'cuisine', 'checkout_price', 'base_price', 'emailer_for_promotion', 'homepage_featured', 'num_orders']
```

Store the changes of columns in trainfinal and display the datatypes of trainfinal using trainfinal.dtypes. Here, we can see that, we not only have numerical data but we also have object data.

```
In [113]: trainfinal = trainfinal[cols]
trainfinal.head()

Out[113]:
```

	id	week	city_code	region_code	center_type	op_area	category	cuisine	checkout_price	base_price	emailer_for_promotion	homepage_featured	num_orders
0	1379560	1	647	56	TYPE_C	2.0	Beverages	Thai	136.83	152.29	0	0	0
